

Drip Drop,  
Drip Drop!

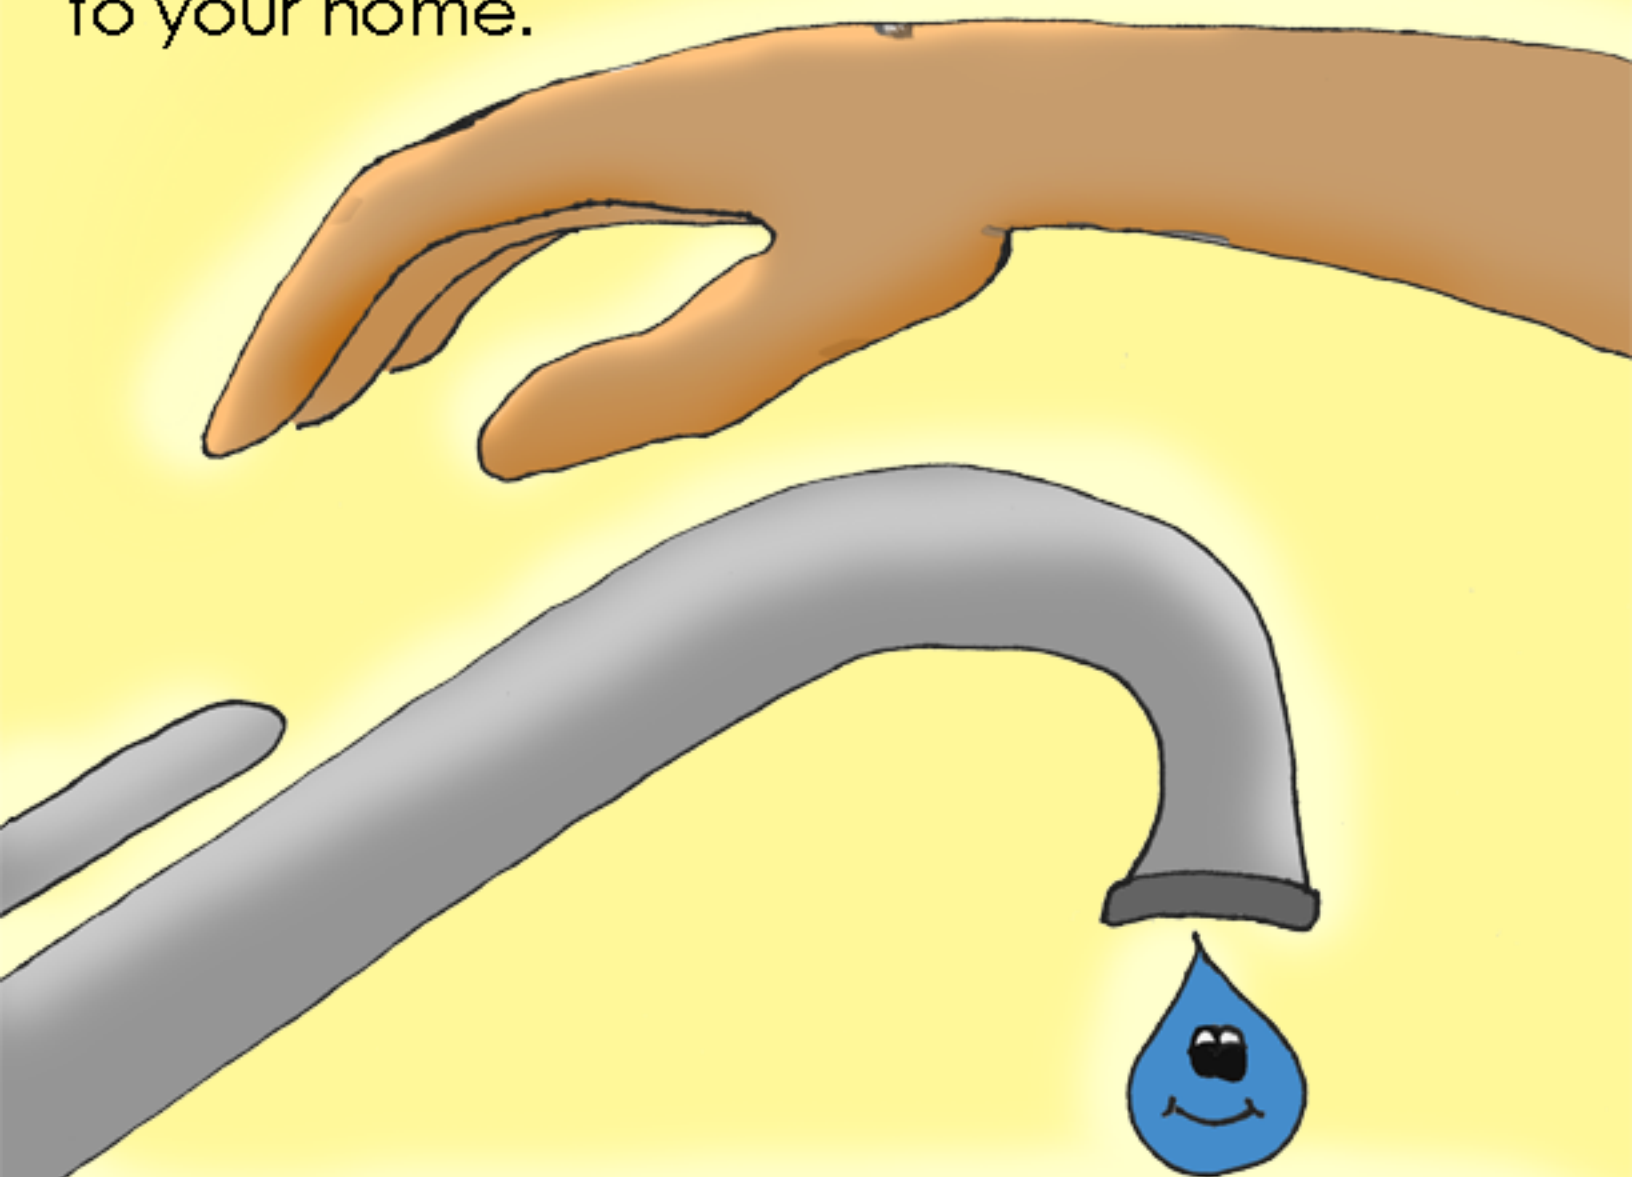

by: Faith HUSSEY

Hey folks! My name is Drippy,  
and i'm a water drop!

And my name is  
Blaze the flame!

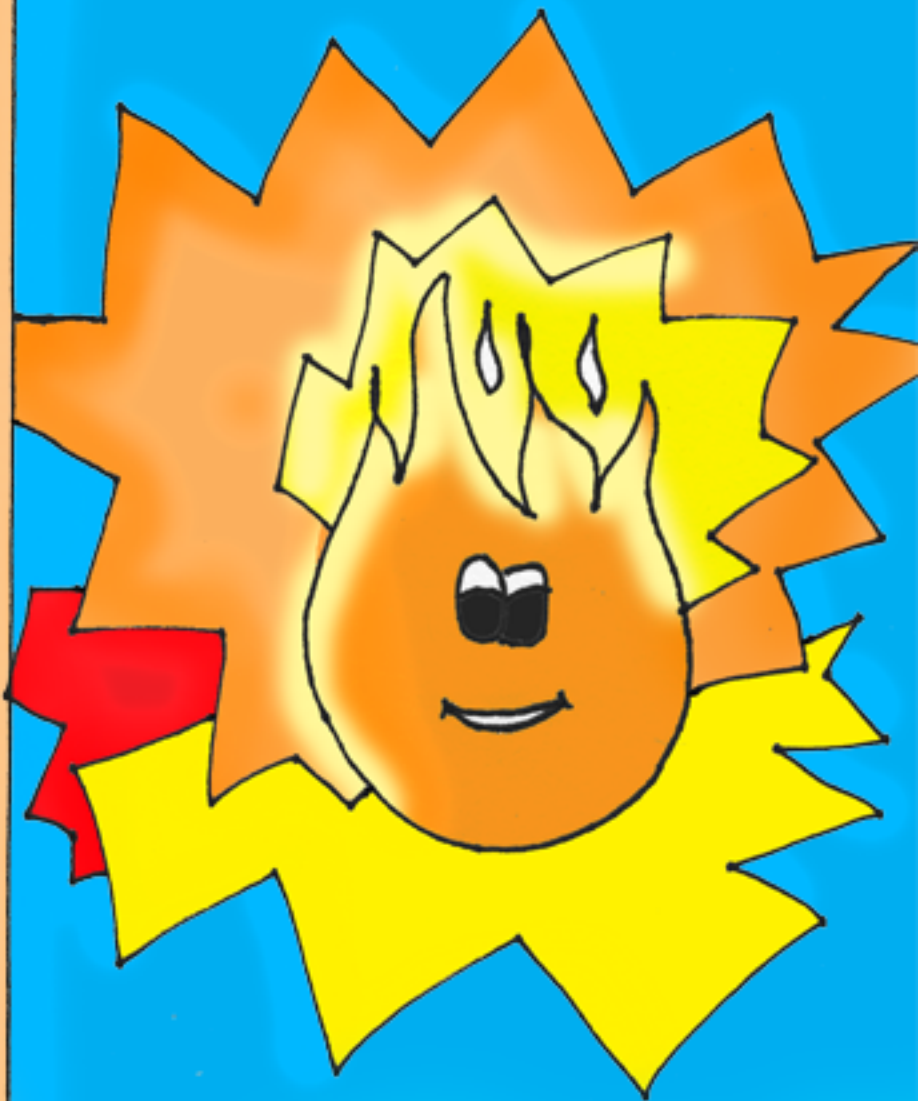

There are plenty of machines that are used to pump the water to your home.

When you don't turn of your water good, then I come dripping out of the faucet.

When carbon dioxide goes into the atmosphere, the earth starts to heat up. It makes a hole in the ozone layer, and mother earth has a booboo.

Even though Blaze is like the complete opposite of me, we are still best buddies. Blaze says, "I try not to heat up, but I can't control myself!"

Remembering to turn off the faucet good is one way you can save energy and water. Wasting water now could affect how much water we have in the future.

The things we do now...

will effect how things are  
in the future when we get older.
